Etiology of pus sepsis instigators of surgical infections

Central District Hospital, Neryungry

Novosibirsk State Medical University

It was conducted a microbiological monitoring of microbe scenery of nosocomial infections instigators during the period of 1999 till 2008. We've got 178 strains of Gram-negative bacterium , 233 Gram-positive ones and 30 strains of other Gram-negative micro-organisms. Gram-positive bacterium are represented by coagula-negative and coagula-positive Staphylococcus, Streptococcus and Enterococcus but Gram-negative ones by fermented bacterium (FGNB):Escherichia coli, Klebsiella spp and other unfermented bacterium (UGNB): Ps.aeruginosa etc.

Keywords: nosocomial infection, purulent surgical infection, Gram-positive bacterium, Gram-negative bacterium.
